

ACCESSION NR: AT4019308

silver concentration are given. The main investigations were carried out on the photosensitive glass 2L. Irradiation was carried out with the PRK-7 lamp at a distance of 400 mm from the sample. The spectra were recorded with an SF-4 quartz spectrophotometer. It was concluded that the photoelectrons, the release of which is connected with the presence of a sensitizer in the glass, pass to the metastable level during irradiation, where they are localized because of the high viscosity of the glass. When heated, the electrons are able to move and are localized in the vicinity of the silver ions, forming the so-called "atomic center". This is accompanied by an increase in absorption in the visible part of the spectrum. At higher temperatures either the size of the centers grows due to the separation of silver on them (after brief exposure) or the size of the particles grows due to their coagulation (prolonged exposure). After the critical sizes are attained these particles become the nuclei of glass crystallization. Orig. art. has: 5 figures.

glass crystallization, nonalkali glass, thermal shock, titanium
glass structure, ultraviolet absorption spectrum

The subject of the study was alkali free glass in the system $SiO_2 - Na_2O$ with admixtures of CaO and Al_2O_3 . The study was carried out in Nov. 1962. The results of the study are presented in the form of a report. The report contains data on the thermal stability of the glass for various intervals, for 1 min. A comparison of the data for various temperatures of heat treatment (see Fig. 1 of the Enclosure) shows that the temperature at which the structural transformations occur increases with temperature.

SOURCE: AN SSSR. Doklady, v. 164, no. 3, 1965, 549-551

TOPIC TAGS: quartz, fused quartz glass, structure defect, uv spectrum, crystallization

ABSTRACT: The investigation was undertaken in order to determine whether the ultraviolet absorption bands which are generated by γ -radiation in fused quartz glass are also generated by crystallization and precrystallization annealing of the glass. The annealing treatment was described previously by L. G. Bayburt and A. A. Gorbachev (DAN, 156, No. 6, 1420, 1964). The spectra of specimens exposed to various temperatures for different time periods are shown graphically on Fig. 1 on the Enclosure. It is concluded that the two absorption bands (210-220 and 290-300 m μ), which appear during crystallization of the quartz glass, are due to structure defects in the silicoon-oxygen tetrahedra. It is suggested that a study of structure defects of glasses during crystallization may lead to a better understanding of structure defects in crystals. Orig. art. has: 2 graphs.

Sektsiya kvanovoy elektroniki. Doklady. Moscow, 1966, 17-23

TOPIC TAGS: laser R and D, solid state laser, laser supply

ABSTRACT: A light-weight RC laser supply has an efficiency of only 30-40%; an LC laser supply has an efficiency up to 95% but its weight may reach hundreds kg for a solid-state laser with a pumping energy within 100-1000 j. Hence, new supply circuits that include thyristors are suggested. Essentially, with the thyristor nonconducting (see Fig. 1), the buffer capacitor C_b is charged.

TITLE: Determination of transfer functions of induction micromachines with a hollow nonmagnetic rotor 21.24, 34

SOURCE: Izvestiya vysshikh uchebnykh zavedeniy. Energetika, no. 7, 1965, 33-39

TOPIC TAGS: servosystem, electric motor, electric resistance, electronic circuit

ABSTRACT: AC servosystems often are based on induction motors and tachogenerators with a hollow nonmagnetic rotor. The authors propose a new method of determining the transfer functions of induction motors and tachogenerators according to the parameters of their equivalent circuits. An amplitude equation for the torque of the induction motor with a hollow nonmagnetic rotor is derived on the basis of the theory of symmetric components of two-phase systems in steady state. An analytic expression of the linear relation of torque to motor RPM is derived on the assumption that, since in induction motors with a hollow nonmagnetic rotor the rotor's resistance is always of a considerable magnitude, it can be generally assumed that in the low RPM range the

UDC: 621.313.333.001.24

L 22095-66

ACC NR: AP6012966

symmetric components of stator currents are practically independent of motor RPM. A new method of determining the parameters of the equivalent circuits of induction motors with a hollow nonmagnetic rotor is described; by means of this method the basic components of the transfer functions of these motors, as well as of tachogenerators with a hollow nonmagnetic rotor, may be determined. Essentially, this method consists in performing a short-circuit experiment on a machine from which the rotor and inner stator are removed and replaced with a drum of nonconducting and nonmagnetic material of a diameter equal to the diameter of the hollow rotor and equipped with a measuring coil supplied with a regulable amount of voltage. The findings are used to calculate the parameters of the equivalent circuit. A more detailed description of this method will be presented in a subsequent article. Orig. art. has: 15 figures. [JPRS]

TITLE: Determination of transfer functions of asynchronous miniature machines with hollow non-magnetic rotors 29

SOURCE: IVUZ. Energetika, no. 3, 1966, 39-44

TOPIC TAGS: miniature electric equipment, servosystem, control circuit, test method, testing laboratory, test facility, test electric power engineering

ABSTRACT: This is a continuation of an article published in IVUZ. Energetika, no. 7, 1966, in which a new method for determining transfer functions of asynchronous miniature machines with hollow non-magnetic rotors by means of equivalent circuits is described. Experiments to determine the parameters of equivalent circuits of asynchronous machines with hollow non-magnetic rotors were carried out in accordance with the new method at the Laboratory for Electrical Miniature Machines and Servo Systems of the Minsk Radio Engineering Institute (Laboratoriya elektricheskikh mikromashin i sledyashchikh sistem Minskogo radiotekhnicheskogo instituta). The experimental data made it possible to determine the transfer functions for a slave motor and a tachometer

Card 1/2 UDC: 621.313.33-181.4

ACC NR: AP6021933

generator. The experimental results are found to be in good agreement with the calculated results. The new method is relatively simple and reflects the actual physical processes taking place in the machines with sufficient accuracy. The main shortcoming of the method is that the short-circuit tests of the machine require the removal of its rotor and stator and, consequently, its disassembly. Orig. art. has: 5 figures, 30 formulas, and 4 tables.

TITLE: Reduction of Metal Consumption in Casting Forging Ingots (Umen'sheniye rashkhoda metalla pri otlivke krupnykh kuznechnykh slitkov)

PERIODICAL: Metallurg, 1958, Nr 11, pp 16 - 18 (USSR)

ABSTRACT: In 1955 electric heating of hot-tops of large carbon and alloy steel ingots was advantageously adopted at the im. Il'icha (im. Il'ich) works. In 1957 the filling of hot tops was increased but further advantage was not obtained. The insulation of the hot top was improved by increasing the thickness of the refractory from 40 to 160 mm (Fig 1), the effectiveness of this being shown with ingots of nominal weights 38 and 54 tonnes of 60KhG and 55Kh steels. A third ingot of nominal weight 35.2 tonnes of type 55 steel was cast with the thickest refractory in but without electric heating of the hot top. The authors give details of these ingots (table) and show sulphur prints of the smaller ingots (Fig 2). Study of these has shown that in all the ingots the pipe, porosity and crude segregation were above the body of the ingot.

Card 1/2

SOV/130-58-11-7/16

Reduction of Metal Consumption in Casting Forging Ingots

Four further ingots were cast with electrical hot top heating: no effect of the changed hot-top configuration on stripping was observed. Joint tests with the Zhdanovskiy metallurgical institute showed that the quality of the metal had not suffered through the considerable reduction in the hot top volume.

There are 2 figures and 1 table.

Production of plated formed iron by electric-arc fusing and rolling

Stal', no. 2, 1964, 149-152

KEYWORDS: plated iron, steel, electric arc fusing, profile iron, SVIKH18N9T electrode, MS 1 steel, ADS 1000 2 welder, AN 26 flux, stainless steel, SVIKH18N9T welder, rolling mill, 620 rolling mill, 450 rolling mill, 400 rolling mill

ABSTRACT: The authors describe a new technique for plating formed iron of different shapes. Several layers of stainless steel were fused onto the samples by the automatic multi-electrode welding method. The chemical composition of the metal plate proved satisfactory ($Cr \geq 16\%$, $Ni \geq 8\%$) when the MS-1 steel and 3-mm SVIKH18N9T electrodes with AN-26 flux were used. The automatic welding assembly ADS-1000-2 was designed to produce simultaneous operation with three electrodes.

Card 1/2

ACCESSION NR: AP4011252

Samples were rolled in mills 620, 450, and 400. Tests showed a strong union of plate with the base metals. In structure, the first layer of the fused-on metal proved to be martensitic and the following layers austenitic. It was determined that the optimal thickness of the metal plate was 1-2 mm. The samples withstood tests for intergranular corrosion even when the angle of bending was 180 degrees. Orig. art. has: 2 tables, 4 figures, and 4 formulas.

TITLE: Repair of Hose-Type Cables on Construction Sites

PERIODICAL: Mekhanizatsiya stroitel'stva, 1959, Nr 5, pp 17-19, (USSR)

ABSTRACT: The article describes the design of movable electric vulcanizing apparatus for mending damaged cables in the field. For 15-23 mm cables the apparatus of the system of V.N. Sibiryakov is employed; for 30-50 mm cables that of Engineer Alad'in. and the author. For maintaining constant temperature of 150°C the apparatus of V.N. Sibiryakov is equipped with a special control device which consists of a transducer and a vibrating switch which cuts the current off upon the limit of temperature being reached and vice versa. The other vulcanizing apparatus works on the same principle but is fitted with a manometric distance gas thermometer of the type TG-278, which automatically controls the temperature of the vulcanizing outfit. The article gives a description of the method of joining a broken cable and of mending it by vulcanizing a rubber cover over the joint. There are 6 diagrams.

Processes and Properties Index

The formation and dewatering of paper by vacuum suction. **A. N. Gorbachev.** *Transtl. Nanch.-Tsingtao Inst. Technol. From. Materials* 1952, Nos. 25-7, 91-117.

The construction details and performance are given of an expel. papermaking machine with section rolls and vacuum wet-press arrangements (diagrams are shown), previously described in the Russ. pats. 119,139, 112,627, 117,701 and 123,626 (1932). The machine, in which some of the features of the Millspaugh patents are evidently incorporated (cf. C. A. 27, 3178), proved to be highly efficient in the formation of continuous sheets of various kinds of paper and board (from 25 to 200 g./sq. m. and higher) of an even and uniform thickness. In their cross and lengthwise tearing strength and bending (folding) strength the resulting papers exceed the standards for similar products formed by conventional methods. Numerous tech. and economic advantages are cited and the adoption of the procedure in the large-scale production is discussed.

ORG: State Astronomical Institute im P. K. Shternberg (Gosudarstvennyy astronomicheskiy institut)

TITLE: Photometric structure of galactic cores

SOURCE: Astronomicheskiy zhurnal, v. 43, no. 1, 1966, 46-51

TOPIC TAGS: galactic core, distribution ^{theory} ~~law~~, ~~Vaucouleurs law~~, ~~elliptic galaxy~~, ~~spiral galaxy~~, ~~instrument contour~~, ~~mass luminosity ratio~~ *luminescence*

ABSTRACT: Measurements of the brightness of galactic cores were performed from photographs obtained at the southern station of the State Astronomical Institute im. P. K. Shternberg in the Crimea. Sections of galactic cores and stars were measured by diaphragms covering a square of arc seconds $1.''6 \times 1.''6$ and readings taken each 0.01 mm. An attempt to find a law for the distribution of surface brightness was unsuccessful. After trying to apply the Vaucouleurs law to the distribution of the surface brightness in elliptic galaxies, this law appeared to be inappropriate for galactic cores. It held true only outside the cores. Measurements were not corrected for the instrument profile and atmospheric turbulence, but the final result was corrected for the instrument contour. Photometric profiles of stars may be approximated to parabola when the distance is large. Photometric profiles were transferred

Card 1/2

UDC: 523.855

L 15764-66

ACC NR: AP6006771

by the Zeipel method to the spatial distribution of densities, which was represented graphically in the original article. Discrepancies between the curves of the surface profiles and the spatial distribution are explained by the importance of small variation in using this method. Applying the mass-to-luminosity ratio to four galactic cores, the numerical value of core densities was obtained, which is given in a table in the original article. The density curves of cores of spiral galaxies and elliptic galaxies show that the former are denser than the latter. Orig. art. has: 5 figures, 3 tables, and 2 formulas. [EG]

AUTHORS: Gorbachev, B. N.; Kink, R. A.; Liyd'ya, G. G.

TITLE: On the dependence of the effectiveness of the exciton and electron-hole energy transfer mechanisms in alkali iodides on the intensity of excitation

SOURCE: AN EstSSR. Institut fiziki i astronomii. Trudy, no. 28, 1964. Issledovaniya po lyuminesentsii (Research on luminescence), 80-92

TOPIC TAGS: luminescence property, luminescence research, luminescence, luminescence spectrum, luminescence yield, luminescent crystal, ultraviolet radiation, phosphor

ABSTRACT: The dependence of the luminescence yield on the intensity of host lattice excitation with monochromatic ultraviolet radiation in certain alkali iodides activated with thallium (NaI, KI, RbI, and CsI) was determined. The investigation was a continuation of the work of E. R. Il'mas, G. G. Liyd'ya, and Ch. B. Lushchik (Opt. i spektr. (v pechatii)). Monocrystals of the phosphors were grown after the method of Kiropulos; all measurements were carried out in vacuum. Quantum yields of luminescence as a function of excitation energy were determined, and the results are shown graphically in Fig. 1 on the Enclosure. It was found that the intensity of the slow luminescence component (attributed to the electron-hole energy transfer

Card 1/3

L 2832-66

ACCESSION NR: AT5021777

6

mechanism) increased with increasing intensity of excitation, and that intensity of the fast component is independent of the intensity of excitation. The x-ray luminescence of CsI - Tl was also studied, and it was found that the efficiency of radioluminescence is independent of the intensity of the excitation radiation. The authors thank Ch. B. Lushchik for suggesting the investigation and for his help in evaluating the experimental results. Orig. art. has: 2 tables and 6 graphs.

ORG: Institute of Physics AN LatSSR (Institut fiziki AN LatSSR)

TITLE: Nonlinear effects in the migration of currentless and current-carrying elementary excitations in I-VII and II-VI crystals

SOURCE: AN LatSSR. Institut fiziki. Radiatsionnaya fizika, no. 4, 1966. Ionnyye kristally (Ionic crystals), 85-97

TOPIC TAGS: light excitation, radioluminescence, photoluminescence, exciton, electron hole

ABSTRACT: The purpose of the investigation was to check experimentally on the idea that the differences between the optical and electrical behavior of I-VII crystals (such as NaCl) and II-VI crystals (such as ZnS) is due to differences in the character of their stable electronic excitations. This was done by studying the dependence of the photoluminescence and radioluminescence of both types of crystals on the volume density by selective generating in the I-VII crystals either excitons or electron-hole pairs, and by selectively generating in the II-VI crystals electron-hole pairs. At the same time, a study was made of the features of the radioluminescence of the II-VI crystals (α/β ratio), which exhibit clearly a nonlinear dependence of their character-

Card 1/2

ACC NR: AT7001787

istics on the volume density of the excitation. . Comparison of the nonlinear effects for both crystals shows that qualitatively the electron-hole mechanism of energy transfer occurs in similar fashion in both classes of crystals. There are, however, quantitative differences in the luminescence saturation and in the absorption. A study was also made of the nonlinear effects produced during photon multiplication as a result of irradiating the crystals with various ionizing particles (α , β , γ , and protons). The results of the experiments are used to discuss the character of the electronic excitations in tracks of α β particles, using α particles from Pu^{239} and β particles from Sr^{90} . The intensity of photoexcitation at which the α and β particles produce equal results was determined. The results also show that by varying the nonlinear characteristics of the scintillator it is possible in principle to change the α/β ratio. Various reasons for the lower yield of alkali crystals compared with ZnS crystals are discussed. The author thanks Ch. B. Lushchik for continuous guidance, R. V. Milenina for synthesizing the ZnS phosphors, and T. A. Soovik and L. A. Pinagorova for help with the measurement of the scintillations. Orig. art. has: 6 figures.

 lubricant, aircraft radio equipment, thermodynamics, gasdynamics, aviation engine

SYNOPSIS AND ABSTRACT: This manual is intended for aircraft technicians with sec-
 ondary technical education. It is a reference manual for flight
 engineers, Air Force and other aviation specialists. The handbook contains
 information on the general disciplines -- physics, thermodynamics, gas-
 dynamics, electrical engineering, radio engineering and the special disciplines --
 strength of materials, aviation materials, aircraft strength, aerodynamics, avia-
 tion engines, aviation fuels and lubricants.

TEXT: A transistorized high efficiency power amplifier is considered. The amplifier is supplied directly from a.c. mains. The high efficiency is achieved owing to the switching mode of operation of transistors. A PA is used for applying the control signals to the bases of transistors. The amplifier designed has shown good exploitation properties and good efficiency. 1) A power of up to 25 OW may be controlled using a single $\Pi-4$ (P-4) transistor, with a voltage of 50 V amplitude applied to the transistor and the load resistance of about 5 ohms; 2) the efficiency is independent of the magnitude of the input signal and is 0.9 - 0.95 (without the efficiency of the transistor itself); 3) a high reliability and stability.

ty with respect to mechanical overloading; 4) economy and lower
amplifier cost, as compared with electromagnetic and magnetic am-
plifiers handling the same currents and powers. 6 references. [Ab-
stracter's note: Complete translation.] ✓
